

Call 2 — Workflow walkthrough with a prospective client

Anonymised call transcript

Anonymised and condensed. Speakers are labelled by role. Covers roughly the first half of the call; the remainder was not retrievable.

Prospect	How are things with you?
Ylookup	Good. We are landing a few interesting projects. We are working with a number of US general partners on replacing their existing outsourced provider, because the switch is easier than people expect — you can start by picking up individual services.
Ylookup	There was a workflow I wanted to walk you through, which is broadly representative of how we run everything. There are small things, like CRS data extraction. And then there are larger ones — we are working with an investor who reads a large set of franchise reports every year and updates their numbers from them. They have an offshore team doing that work, and it takes two months every year because it is roughly a hundred and thirty separate reports. We can run that overnight.
Prospect	Interesting.
Ylookup	When they see it, the reaction is immediate. The value arbitrage is interesting when you are talking to someone with a technical perspective. When you go to a head of accounting or a finance team who are consolidating data across fifteen different fund administrators manually, they are struggling enormously to do that work.
Prospect	But how does that work if they already have an agreement with an existing fund administrator, where all of these services are bundled into the framework agreement? Are they open to running you alongside while they still have them?
Ylookup	We start with a proof of concept. We take a meaty workflow — NAV valuation or something of that scale — run it, and hand the result back to them.
